

Evolution's the solution
to the data that we find,
when we study bones and fossils
and we keep an open mind.

Stegosaurus, Oviraptor, and Tyrannosaurus Rex roamed this planet earth before us so their skeletons attest.

Through Triassic, and Jurassic, and Cretaceous days long past, they survived until an asteroid struck with a mighty blast.

And as time went by a biped
put its hand to making tools,
and soon many others followed
for, you see, they were not fools.

But Australopiths, Neandertals,
our cousins you might say,
who contrived to thrive for many years
cannot be found today.
