

IDC proponent Michael Behe claims that “irreducible complexity” applies only to cells and molecules, not to adaptive features in organs or major groups of organisms.

This is a false statement.

In *Of Pandas and People* the implications of “IC” are repeatedly extended to adaptations and whole organisms.

Michael Behe is listed as a “critical reviewer” of *Pandas*, but he also wrote the sections on biochemistry that deal with blood clotting proteins (2nd edition).

To believe what Behe says, we must accept:

- (1) Behe had no knowledge that his co-authors misappropriated his concept above the molecular level; OR**
- (2) “IC” is not only a molecular concept.**
